Heuristic Evaluation

Workbook

Use this workbook to conduct your own heuristic evaluation.

For each of Jakob's 10 Usability Heuristics, look for specific places where the interface fails to adhere to the guideline. Write your recommendations for how to fix those usability issues.

Product: G6 Market

Task: To Evaluate

Heuristic Evaluation

Workbook

1

Visibility of System Status

The design should always keep users informed about what is going on, through appropriate feedback within a reasonable amount of time.

- Does the design clearly communicate its state? Is feedback presented quickly after user actions?
-

Issues

N/A

Recommendations

N/A

2

Match Between System and the Real World

The design should speak the users' language. Use words, phrases, and concepts familiar to the user, rather than internal jargon. Follow real-world conventions, making information appear in a natural and logical order.

- Will user be familiar with the terminology used in the design? Do the design's
- controls follow real-world conventions?
 -

Issues

N/A

Recommendations

N/A

Heuristic Evaluation Workbook

4 User Control and Freedom

Users often perform actions by mistake. They need a clearly marked "emergency exit" to leave the unwanted action without having to go through an extended process.

- Does the design allow users to go back a step in the process?
- Are exit links easily discoverable?
- Can users easily cancel an action? Is
- *Undo* and *Redo* supported?

Issues

N/A

Recommendations

N/A

4 Consistency and Standards

Users should not have to wonder whether different words, situations, or actions mean the same thing. Follow platform and industry conventions.

- Does the design follow industry conventions?
- Are visual treatments used consistently throughout the design?

Issues

The current design suffers from significant **inconsistency in the bottom navigation**, which shifts between mockups and disrupts user flow. This is worsened by a **mismatched design language**, where categories flip-flop between buttons and text lists, and **label confusion** caused by using the term "Categories" for both navigation tabs and headers.

Recommendations

To fix this, the **navigation must be unified** into a single, predictable bar used across all screens. The team should **harmonize the styling** by selecting one visual treatment for categories and implementing **distinct labeling** to ensure navigation levels are unique and easy to understand.

Heuristic Evaluation Workbook

Error Prevention

Good error messages are important, but the best designs carefully prevent problems from occurring in the first place. Either eliminate error-prone conditions, or check for them and present users with a confirmation option before they commit to the action.

- Does the design prevent slips by using helpful constraints?
- Does the design warn users before they perform risky actions?

Issues

Accidental use of limited spins.

.Types leading to empty search results.

Missing "Minimum Spend" requirements.

Recommendations

Add a confirmation pop-up before the action.

Implement auto-suggest and check.

Warn users with a tooltip if requirements aren't met.

6

Recognition Rather Than Recall

Minimize the user's memory load by making elements, actions, and options visible. The user should not have to remember information from one part of the interface to another. Information required to use the design (e.g. field labels or menu items) should be visible or easily retrievable when needed.

- Does the design keep important information visible, so that users do not have to memorize it?
- Does the design offer help in-context?

Issues

N/A

Recommendations

N/A

Heuristic Evaluation Workbook

Flexibility and Efficiency of Use

Shortcuts — hidden from novice users — may speed up the interaction for the expert user such that the design can cater to both inexperienced and experienced users. Allow users to tailor frequent actions.

- Does the design provide accelerators like keyboard shortcuts and touch gestures?
- Is content and functionality personalized or customized for individual users?

Issues

N/A

Recommendations

N/A

8

Aesthetic and Minimalist Design

Interfaces should not contain information that is irrelevant or rarely needed. Every extra unit of information in an interface competes with the relevant units of information and diminishes their relative visibility.

- Is the visual design and content focused on the essentials?
- Have all distracting, unnecessary elements been removed?

Issues

N/A

Recommendations

N/A

Heuristic Evaluation Workbook

Help Users Recognize, Diagnose, and Recover from Errors

Error messages should be expressed in plain language (no error codes), precisely indicate the problem, and constructively suggest a solution.

- Does the design use traditional error message visuals, like bold, red text?
- Does the design offer a solution that solves the error immediately?

Issues

N/A

Recommendations

N/A

10 Help and

Documentation

It's best if the system doesn't need any additional explanation.

However, it may be necessary to provide documentation to help users understand how to complete their tasks.

- Is help documentation easy to search?
- Is help provided in context right at the moment when the user requires it?

Issues

The current design lacks a visible "Help" or "FAQ" button on the main navigation or the "Events" screen, making it hard for users to find support when they need it. There is also no immediate access to rules for the "Spin the Wheel" feature or coupon "Min. spend" requirements, leaving users to guess how these rewards work.

Recommendations

The prototype app should feature a searchable Help Center within the "Profile" tab to make documentation easy to find. Adding small information icons next to specific reward requirements would provide help in context at the exact moment a user requires it. And a quick onboarding guide for the "Events" section would help users understand the system without needing to leave the page.
